Mr. Neil O'Connor, P.E.  
City of Albany  
Department of Water and Water Supply  
10 North Enterprise Dr  
Albany, NY 12204

**RE: Sanitary Sewer Capacity Evaluation  
19 Erie Boulevard  
Redburn Development Partners  
MJ1459.01**

Dear Mr. O'Connor:

This letter is in regard to the proposed redevelopment of the property located at 19 Erie Boulevard (Tax Map No. 65.16-5-4.1) within the City of Albany. Specifically, Redburn Development Partners is planning to redevelop this property into a 294-unit apartment complex. Included in Attachment A are calculations deriving the theoretical maximum day and peak hourly wastewater flows from the proposed apartment complex which are as follows:

- Maximum Day Flow: 32,340 gpd (22 gpm)
- Peak Hourly Flow: 128,390 gpd (90 gpm)

There is an existing 8-inch PVC sanitary sewer located along Erie Boulevard, approximately 1,300 feet in length, which discharges to an existing City-owned 54-inch trunk sewer located on the west side of Erie Boulevard. Included in Attachment A are calculations deriving the theoretical capacity of the existing 8-inch sewer based on sewer material, diameter and invert elevations which were field verified by Redburn Development Partners in September 2021. Refer to Attachment B for mapping of the existing 8-inch sanitary sewer.

The theoretical capacity of the existing 8-inch sanitary sewer is limited by the 0.07% sewer slope between manholes MH 2 and MH 3. This sewer section does not comply with the minimum recommended slope per Recommended Standards for Wastewater Facilities (i.e., 10 States) for an 8-inch sewer of 0.004 ft/ft (0.4%). As a result, this sewer section will have reduced flow velocities and a higher potential for solids settling, particularly during low to average flow conditions. Further, this could result in sewer backups if peak flow conditions are unable to flush the settled solids from the sewer. Therefore, it is not recommended that 19 Erie Boulevard property connect to the existing 8-inch sewer upstream of MH 3.

Downstream of MH 3, the theoretical capacity of the existing 8-inch sanitary sewer is 433 gpm and limited by the 0.38% sewer slope between MH 4 and MH 5.

Flow monitoring was performed from 8/18/2021 to 9/1/2021 at the farthest downstream manhole (MH 6) located along the existing 8-inch sanitary sewer (i.e., immediately upstream of the connection to the 54-inch trunk sewer) for purposes of evaluating existing sanitary flows. Based on the flow monitoring data included in Attachment C, the current average daily and peak hourly flows in the existing 8-inch sanitary sewer are as follows:

- Current Average Daily Flow: 6,912 gpd (4.8 gpm)
- Current Peak Hourly Flow: 41,328 gpd (28.7 gpm)

Based on theoretical peak wastewater flows from the apartment complex (90 gpm) and current peak sanitary flows per flow monitoring data (29 gpm), the total projected peak sanitary flow within the existing 8-inch sanitary sewer is anticipated to be 119 gpm. Assuming that the 19 Erie Boulevard property is connecting downstream of MH 3, the remaining available capacity in the sewer following connection of the proposed apartment complex will be 314 gpm (433 gpm – 119 gpm).

While the sanitary sewer capacity calculations indicate there is sufficient capacity to receive and convey both current and proposed sanitary flows associated with the redevelopment of 19 Erie Boulevard (if connected downstream of MH

3), the existing 8-inch sanitary sewer between MH 4 and MH 5 was found to be installed at a slope (0.38%) which is below the minimum recommended slope per Recommended Standards for Wastewater Facilities (0.4%).

Therefore, the developer has agreed to a routine inspection and maintenance plan for the existing 8-inch sewer which would be implemented to minimize the potential for any significant accumulation of solids (and associated sewer backups) from occurring. This would include the following, immediately occurring after the 19 Erie Blvd property is connected to the 8-inch sewer:

- Perform routine CCTV Inspection of the entire 8-inch sewer to determine if and/or when cleaning is required.
  - Bi-weekly inspection for the first two (2) months
  - Bi-weekly and/or monthly inspection for the next ten (10) months
  - After 12 months: Re-evaluate inspection frequency based on previous 12 months CCTV findings
- Perform cleaning of the 8-inch sewer to remove accumulated solids as necessary based on findings from the routine sewer inspections (i.e., CCTV).

The developer is currently proceeding with the design phase of the new sewer connection from the proposed apartment complex to the existing 8-inch gravity sewer downstream of manhole MH 3. If the City has any questions or concerns with the approach outlined herein, please do not hesitate to contact me at (518) 371-0799 or [mdrislane@mjels.com](mailto:mdrislane@mjels.com).

Sincerely,

Matt Drislane, P.E.  
Project Manager
